Wolverine Mapping Project

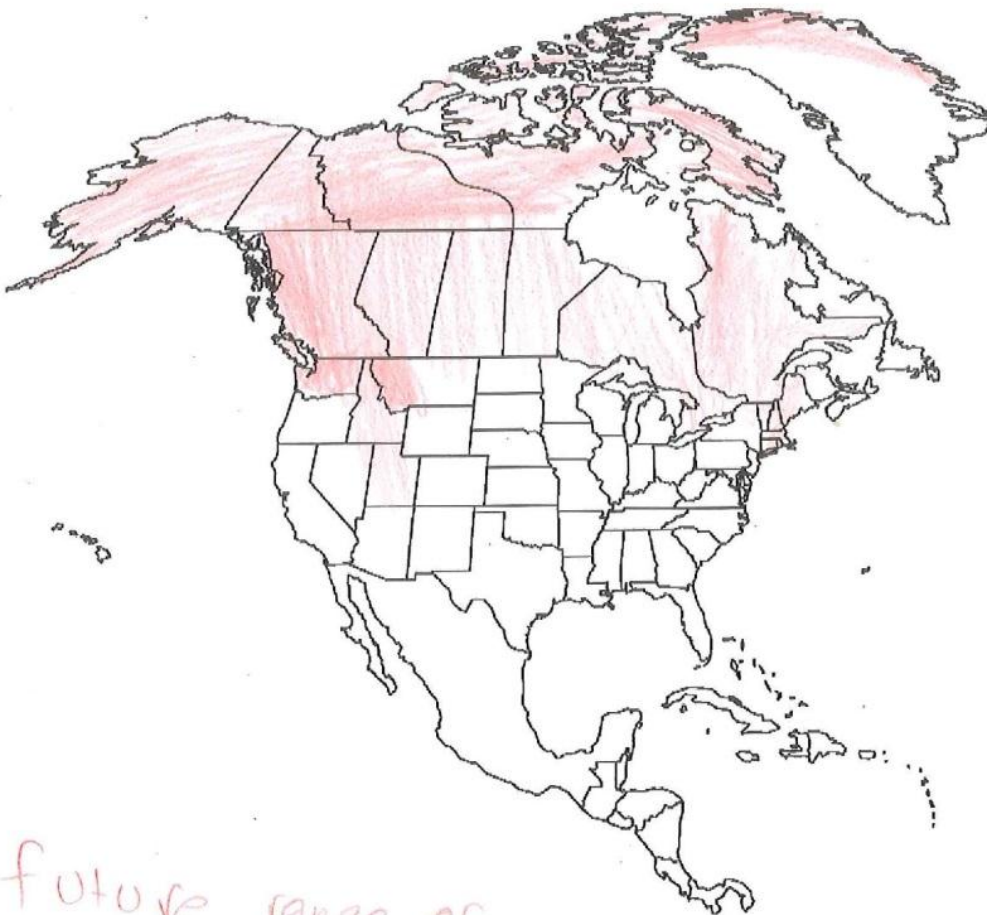

We researched the wolverine and learned where it used to live and where it lives now. We made maps of its distribution in North America (the wolverine also lives in Europe). The wolverine used to live in all of Canada and a lot of the United States – wherever there was snow. Now, the wolverine still lives in many places in Canada but there are not very many in the United States. The ones in the United States were trapped and poisoned, and they have large territories so they have trouble finding places with enough space.

In the future, we think that the wolverine will live all over Canada because there is enough space for their territories. We also think the wolverine will live in the Cascade mountains. It will be hard for the wolverine to live in the rest of the United States because of global warming. Wolverines need snow to make their dens in and there will not be enough snow for them in the United States.
